

AI Assistant Coding Assignment-6.4

Name of Student : V. Abhinav Batch : 41
Enrollment No. : 2303A52486

Task 1: Student Performance Evaluation System

Create the skeleton of a Python class named Student with the attributes:

- name
- roll_number
- marks

Prompt:

Write a python code with class and attributes name, roll_number and marks. That displaying student details and checks whether the student's marks are above the class average and returns an appropriate message. And takes inputs from the user and asks the user to know which Student details or Student is above or below average.

Code:

```
1  class Student:
2      def __init__(self, name, roll_number, marks):
3          self.name = name
4          self.roll_number = roll_number
5          self.marks = marks
6
7      def display_details(self):
8          print(f"Name : {self.name}")
9          print(f"Roll No. : {self.roll_number}")
10         print(f"Marks : {self.marks}")
11
12     def above_average_message(self, class_average):
13         if self.marks > class_average:
14             return f"{self.name} (Roll No. {self.roll_number}) is ABOVE the class average."
15         elif self.marks < class_average:
16             return f"{self.name} (Roll No. {self.roll_number}) is BELOW the class average."
17         else:
18             return f"{self.name} (Roll No. {self.roll_number}) is EXACTLY at the class average."
19
20
21     def main():
22         students = []
23
24         # Take number of students
25         n = int(input("Enter the number of students: "))
26
27         # Take input for each student
28         for i in range(n):
29             print(f"\nEnter details for student {i + 1}:")
30             name = input(" Enter name: ")
31             roll_number = input(" Enter roll number: ")
32             marks = float(input(" Enter marks: "))
33
34             students.append(Student(name, roll_number, marks))
35
36         # Compute class average
37         total_marks = sum(s.marks for s in students)
38         class_average = total_marks / n if n > 0 else 0
39         print(f"\nClass average marks: {class_average:.2f}")
```

```

● Assign6.py > main
21 def main():
36     # Compute class average
37     total_marks = sum(s.marks for s in students)

87             print("Invalid choice. Please enter 1, 2, 3, or 4.")
88
89
90     if __name__ == "__main__":
91         main()

```

Output:

```
PS C:\Users\Abhi\Documents\AI Assistant Coding & C:/Users/Abhi/AI
.exe "c:/Users/Abhi/Documents/AI Assistant Coding/Assign 6.py"
Enter the number of students: 3

Enter details for student 1:
Enter name: Abhi
Enter roll number: 101
Enter marks: 85

Enter details for student 2:
Enter name: Boby
Enter roll number: 102a
Enter marks: 74

Enter details for student 3:
Enter name: Shashi
Enter roll number: a103
Enter marks: 90.5

class average marks: 83.17

What would you like to do?
1. See a student's details and above/below average status
2. See all students who are above average
3. See all students who are below average
4. Exit
Enter your choice (1-4): 1
Enter the roll number of the student: 101

Student details:
Name      : Abhi
Roll No.  : 101
Marks    : 85.0
Abhi (Roll No. 101) is ABOVE the class average.
```

Explanation:

This task evaluates a Python login system generated using an AI tool, focusing on basic security practices. The analysis checks whether credentials are hardcoded, whether passwords are stored or compared in plain text, and whether insecure logic exists. The revised code improves security by using salted PBKDF2 hashing instead of plain-text passwords and avoids hardcoded

credentials by storing user data externally. Additional safeguards such as input validation and limited retry attempts reduce common attack risks. The output demonstrates successful registration and login while correctly rejecting invalid credentials.

Task 2: Data Processing in a Monitoring System

Write the initial part of a for loop to iterate over a list of integers representing sensor readings.

Add a comment prompt instructing GitHub Copilot to:

- Identify even numbers
- Calculate their square
- Print the result in a readable format

Allow Copilot to complete the remaining loop logic.

Prompt:

Write a python code which has a for loop to iterate over a list of integers representing sensor readings, also Identifies even numbers, Calculates their square and Print the result in a readable format. And takes inputs from the user and asks the user to know which to display.

Code:

```

Assign 6.py > ...
95  # Step 1: Take sensor readings from the user
96  n = int(input("Enter the number of sensor readings: "))
97
98  sensor_readings = []
99  for i in range(n):
100     value = int(input(f"Enter reading {i + 1}: "))
101     sensor_readings.append(value)
102
103 # Step 2: Main loop for user choices
104 while True:
105     print("\nWhat would you like to display?")
106     print("1. All sensor readings")
107     print("2. Only even sensor readings")
108     print("3. Even sensor readings and their squares")
109     print("4. Exit")
110
111     choice = input("Enter your choice (1-4): ")
112
113     if choice == "1":
114         print("\nAll sensor readings:")
115         for reading in sensor_readings:
116             print(reading, end=" ")
117         print()
118
119     elif choice == "2":
120         print("\nEven sensor readings:")
121         found = False
122         for reading in sensor_readings:
123             if reading % 2 == 0:
124                 print(reading, end=" ")
125                 found = True
126             if not found:
127                 print("No even readings found.", end="")
128             print()
129

.exe "c:/Users/Abhi/Documents/AI Assistant Coding"
Enter the number of sensor readings: 5
Enter reading 1: 10
Enter reading 2: 7
Enter reading 3: 3
Enter reading 4: 4
Enter reading 5: 9

What would you like to display?
1. All sensor readings
2. Only even sensor readings
3. Even sensor readings and their squares
4. Exit
Enter your choice (1-4): 1

All sensor readings:
10 7 3 4 9

What would you like to display?
1. All sensor readings
2. Only even sensor readings
3. Even sensor readings and their squares
4. Exit
Enter your choice (1-4): 3

Even sensor readings and their squares:
Reading: 10 -> Square: 100
Reading: 4 -> Square: 16
```

Explanation: This task analyzes an AI-generated loan approval system to check for fairness and bias. The prompt intentionally varies applicant names and genders to see if decisions are influenced by irrelevant personal attributes. The code bases approval strictly on financial factors such as income, expenses, credit score, loan amount, and employment status. Since no gender, name, or demographic attributes are used in decision-making, the logic is fair and objective. The output confirms that approval decisions depend only on eligibility metrics, ensuring ethical behavior.

Task 3: Banking Transaction Simulation

Create the structure of a Python class named `BankAccount` with attributes:

- `account_holder`
- `balance`

Use GitHub Copilot to complete methods for:

- Depositing money
- Withdrawing money
- Preventing withdrawals when the balance is insufficient

Prompt:

Create a python class named `BankAccount` with attributes `account_holder`, `balance` and asks the user to for Depositing money and Withdrawing money also Preventing withdrawals when the balance is insufficient.

Code:

```
Assign 6.py > ...
148     # # Task-3
149     class BankAccount:
150         def __init__(self, account_holder, balance=0.0):
151             self.account_holder = account_holder
152             self.balance = balance
153
154         def deposit(self, amount):
155             if amount <= 0:
156                 print("Deposit amount must be positive.")
157             else:
158                 self.balance += amount
159                 print(f"Deposited {amount:.2f}. New balance: {self.balance:.2f}")
160
161         def withdraw(self, amount):
162             if amount <= 0:
163                 print("Withdrawal amount must be positive.")
164             elif amount > self.balance:
165                 print("Insufficient balance. Withdrawal not allowed.")
166             else:
167                 self.balance -= amount
168                 print(f"Withdrew {amount:.2f}. New balance: {self.balance:.2f}")
169
170         def display_details(self):
171             print(f"Account Holder: {self.account_holder}")
172             print(f"Current Balance: {self.balance:.2f}")
173
174
175     def main():

```

Output:

```
PS C:\Users\Abhi\Documents\AI Assistant Coding\Bank Management System> python .exe "c:/Users/Abhi/Documents/AI Assistant Coding/Bank Management System/main.py"
Enter account holder name: Abhi
Enter opening balance: 80000

What would you like to do?
1. Deposit money
2. Withdraw money
3. Show account details
4. Exit
Enter your choice (1-4): 1
Enter amount to deposit: 20000
Deposited 20000.00. New balance: 100000.00

What would you like to do?
1. Deposit money
2. Withdraw money
3. Show account details
4. Exit
Enter your choice (1-4): 3
Account Holder: Abhi
Current Balance: 100000.00
```

Explanation:

This task focuses on generating and analyzing a recursive binary search algorithm for clarity and explainability. The code clearly defines the base case (search space exhausted) and recursive cases (searching left or right subarrays). Inline comments align well with the logic, making the recursion easy to follow for beginners. The explanation highlights how recursion reduces the problem size at each step. The output verifies correct functionality by locating the target element's index in a sorted list.

Task 4: Ethical Evaluation of AI-Based Scoring Systems Scenario

Ask an AI tool to generate a job applicant scoring system based on features such as:

- Skills
- Experience
- Education

Analyze the generated code to check:

- Whether gender, name, or unrelated features influence scoring
- Whether the logic is fair and objective

Prompt:

Generate a job applicant scoring system in python based on features such as:

- Skills
- Experience
- Education etc.

Code:

```
Assign 5.py > ...
# Task-4: Job Applicant Scoring System

311
312     from dataclasses import dataclass

```

1. No bias-prone data - The scoring system only uses:

- Skills (job-relevant)
- Experience (measurable years)
- Education level (verifiable credential)
- Certifications (verifiable credential)
- GPA (measurable)
-

2. Name is NOT used in scoring - The name field is only used for reporting/display. It has zero impact on the score calculation.

3. No demographic data - There's no gender, age, race, ethnicity, or any protected characteristics in the scoring logic.

4. Transparent, deterministic logic - Each scoring method is objective and reproducible:

- Skills: percentage match against requirements
- Experience: linear scale between min/max
- Education: level-based scoring
- Certifications: percentage match
- GPA: linear scale

```

--- Enter Applicant Information ---
Applicant name: Abhinav
Skills (comma-separated): Python, Java, AIML, Git
Years of experience: 2

Education Levels:
1) HIGH SCHOOL
2) ASSOCIATE
3) BACHELOR
4) MASTER
5) PHD
Select education level (1-5): 3
Certifications (comma-separated): AIML Specialization-IIITH, AWS Certified
GPA (0.0-4.0): 3.6
Previous roles (comma-separated): Computer Vision Intern

=====
APPLICANT SCORING REPORT: Abhinav
=====

Background:
Skills: Python, Java, AIML, Git
Experience: 2.0 years
Education: BACHELOR
Certifications: AIML Specialization-IIITH, AWS Certified
GPA: 3.6
Previous Roles: Computer Vision Intern

Scores:
Skills Match: 66.7/100
Experience: 0.0/100
Education: 20.0/100
Certifications: 50.0/100
GPA: 88.9/100

Overall Score:          40.4/100
Recommendation:        WEAK - Not recommended
=====
```

Explanation:

In this task, an AI-generated job applicant scoring system is examined for ethical fairness. The scoring logic uses only job-relevant features such as skills, experience, education level, certifications, and GPA. Sensitive or protected attributes like gender, age, or name are excluded from the scoring mechanism, ensuring unbiased evaluation. The system follows transparent and deterministic rules, making results reproducible and explainable. The output provides a detailed scoring breakdown and recommendation, reinforcing trust and accountability.

Task 5: Inclusiveness and Ethical Variable Design Scenario

Use an AI tool to generate a Python code snippet that processes user or employee details.

Analyze the code to identify:

- Gender-specific variables (e.g., male, female)
- Assumptions based on gender or identity
- Non-inclusive naming or logic

Modify or regenerate the code to:

- Use gender-neutral variable names
- Avoid gender-based conditions unless strictly required
- Ensure inclusive and respectful coding practices

Prompt:

Generate a Python code that processes user or employee details, take user input.

Code:

```

✓ Employee Sarah Sharma added successfully.
```

Explanation:

This task assesses whether AI-generated employee-processing code follows inclusive and respectful coding practices. The analysis identifies and removes gender-specific variables or assumptions, replacing them with gender-neutral naming conventions. The revised code avoids unnecessary identity-based conditions and focuses only on relevant employee attributes. Input validation and clean data handling improve robustness and inclusivity. The output shows successful employee data processing using ethical and inclusive design principles.
